

Tempra wiring in a 3 Phase Environment

The Stebel Eltron Tempra units are designed to use single phase power. In order to wire a Tempra unit in a building which has 3 phase power, install a single phase breaker for each separate circuit being connected to the wiring block of the Tempra unit (see page 6 of the Tempra installation manual). Each circuit should be connected to the 3 phase power source as shown in the diagram above. The proper size and number of circuit breakers can be determined from page 9 of the Tempra installation manual.
